LINSHUO LI

Shanghai, China | lilianzdq888@gmail.com | linkedin.com/in/lilian-li-856014299

PROFILE

User researcher with a psychology and behavioural-science background; coursework and degree projects in game design and player research (playtest-driven board-game design; a survey of MMORPG players' purchase motivations), plus a product internship working with behavioural data. Seeking user research roles, including games and player research.

EDUCATION

MSc Design with Behaviour Science, Imperial College London 2025 – 2026

- Graduated with Merit.
- Modules include: Design Analytics for Sharing Economy, Inferential Statistics and Causal Reasoning, Design Engineering Practice, Design Psychology, Transformational Play.

BSc Psychology, University College London (UCL) 2022 – 2025

- Graduated with a High 2:1.
- Modules include: Human-Computer Interaction (HCI), Behaviour Change, Computer Programming.

PROJECTS

For the Gram – Transformational Play (team), Imperial College London 2026

- Designed three mechanics within a team-built board game on trend-chasing tourism in Oʻahu: the base map, an Instagram-style like-accumulation mechanic, and a glass-jar spending feedback with an end reveal of environmental harm; playability mechanics and physical production were done by the team.
- The team iterated through six versions in response to playtest feedback from the team, outside players and teaching assistants, for example adding a player-versus-environment reveal after feedback that the reveal lacked impact; the final version has not yet been evaluated.

Social factors and in-game purchases – final-year research project (individual, supervised), UCL 2025

- Online survey of MMORPG players (Qualtrics, recruited via Prolific; LSAS plus open questions) with thematic analysis; 34 started, 19 analysed; contributed to the research questions and to materials and methods, and collected and analysed the data independently.
- Players' accounts repeatedly cited social reasons for buying; LSAS did not significantly relate to item type, probability-based item experience or spending, and no causal claim is made.

Calm by Default – Product Design (individual), Imperial College London 2026

- Led two co-design workshops with 10 university students, using a notification journey map to find where pressure arises and what drives phone use after a notification; ran an exploratory survey (n=31) to see whether the themes appeared in another group.
- Synthesised findings through thematic analysis, COM-B and the Fogg Behaviour Model into design requirements and principles; designed Calm Profile, a system-level notification mode, as an interactive Figma prototype.
- Ran a scenario-based usability test (n=6) on concept understanding, activation and control, and made three design refinements informed by participant feedback.

Our Orchard – App Product Design (team), Imperial College London 2026

- Conducted stakeholder insight interviews with six participants on how couples share and coordinate household tasks; synthesised three themes: tasks are invisible, asking for help adds to the load, and partners perceive difficulty differently.
- Explained each theme with COM-B and Self-Determination Theory and traced it to a prototype feature (task visualisation, dual difficulty rating, light communication prompts); benchmarked against existing task and calendar tools.
- Team project: my part was the interview research, data analysis and the behavioural theory behind the design rationale; the prototype UI was built by the team.
- Showed participants the design framework and rationale; feedback included liking the apple metaphor and visual expression and a need for low-cost communication, and the team then added a meme-style encouragement and support feature (qualitative feedback, not a usability test).

London Nudgeathon 2025 – FAO of the United Nations (team Highly commended) 2025

- Designed a savings intervention for women farmers in Sierra Leone in a 48-hour challenge, applying COM-B and APEASE to develop group-goal and agricultural-insurance incentives.
- Proposed a three-stage quasi-experimental evaluation plan to measure practicality, impact and sustainability.

EXPERIENCE

Intern Product Manager, Alibaba／阿里巴巴, Remote June 2026 – 12 Oct 2026

- Analysed nearly 30,000 maternal and infant transaction records; cleaned the data, identified bulk orders that distorted sales, and switched to buyer penetration to compare category preferences across the 400 age-band × category combinations observed.
- Found that child-age labels covered only 3.2% of records, and tested whether purchase behaviour could predict age (classifiers against a dummy baseline, with recall by age band); it could not do so reliably.
- Built an offline, rule-based age-specific Top-K category list and compared it with a global-popularity baseline (known true age, single split): hit rate was 5.3 percentage points higher at Top-20, while the baseline was slightly better at Top-5 and Top-10, which does not establish a consistent advantage; proposed age-informed page-design suggestions for the team to test.

Qualitative Method Researcher (Volunteer), Sister System, London 2025

- Reviewed seven qualitative approaches (including Most Significant Change, Goal Attainment Scaling and Process Tracing) to support research and evaluation design for a women's support programme.
- Combined the Blue Cabin Framework, MSC and Story Circle into a practical research-methods handbook, reviewed by the project lead.

SKILLS

Research: user interviews, surveys, co-design workshops, usability testing, thematic analysis

Data & analysis: Python, RStudio, Excel, statistical analysis, exploratory data analysis

Design & prototyping: Figma interactive prototyping, wireframing, user flows

Research tools: NVivo, Qualtrics, Gorilla, Prolific, XMind

Languages: Mandarin Chinese; English (Advanced; IELTS 7.5)
