LINSHUO LI

Shanghai, China | lilianzdq888@gmail.com | linkedin.com/in/lilian-li-856014299

PROFILE

Data-informed, behaviourally trained product intern with strong analytical, user-centred design and behavioural science skills, developed through a behavioural-data internship and UX research and product design projects. I define the user and business problem first, compare options, explain trade-offs, and tie each recommendation to its research evidence. Seeking product roles.

EDUCATION

MSc Design with Behaviour Science, Imperial College London 2025 – 2026

- Graduated with Merit.
- Modules include: Design Analytics for Sharing Economy, Inferential Statistics and Causal Reasoning, Design Engineering Practice, Design Psychology, Transformational Play.

BSc Psychology, University College London (UCL) 2022 – 2025

- Graduated with a High 2:1.
- Modules include: Human-Computer Interaction (HCI), Behaviour Change, Computer Programming.

EXPERIENCE

Intern Product Manager, Alibaba／阿里巴巴, Remote June 2026 – 12 Oct 2026

- Analysed nearly 30,000 maternal and infant transaction records; cleaned the data and identified bulk orders that distorted sales rankings, then switched to buyer penetration to compare category preferences across the 400 age-band × category combinations observed.
- Judged whether child age is worth segmenting on: age labels covered only 3.2% of records, and classifiers against a dummy baseline (with recall by age band) showed purchase behaviour does not reliably reveal age, so I recommended age as a coarse auxiliary signal.
- Built an offline age-based Top-K category prototype and compared it with a global-popularity baseline (known true age, single split): hit rate was 5.3 percentage points higher at Top-20, the baseline slightly better at Top-5 and Top-10, so no consistent advantage is established.
- Turned the findings into page-level suggestions (age filters, age-grouped reviews, safety and age-suitability information) with short- and medium-term priorities by expected effect and effort, for the team to test.

Qualitative Method Researcher (Volunteer), Sister System, London 2025

- Reviewed seven qualitative approaches (including Most Significant Change, Goal Attainment Scaling and Process Tracing) to support research and evaluation design for a women's support programme.
- Combined the Blue Cabin Framework, MSC and Story Circle into a practical research-methods handbook, reviewed by the project lead.

Interviewer, The Times Graduate Survey, High Fliers Research Ltd, London Jan – Feb 2025

- Interviewed 25 final-year students in 10 days, using rapport-building and probing techniques to capture candid accounts of graduate career intentions.

External Promotion Project (Part-time), NetEase Media Technology Co., Remote Aug – Sep 2024

- Tested an early AI emotional companion product; managed content planning, production and posting on Xiaohongshu, designing interactive content around trending topics.
- Segmented target users by product characteristics across topic scenarios, reaching 2,000+ total views within 15 days.

PROJECTS

Calm by Default – Product Design (individual), Imperial College London 2026

- Reframed the problem from "block more notifications" to "stay reachable without having to keep checking": led two co-design workshops (10 students) using a journey map to find where pressure arises, and ran an exploratory survey (n=31) to see whether the themes appeared in another group.
- Combined thematic analysis, COM-B and the Fogg Behaviour Model into design requirements and three principles; chose a system-level mode (Calm Profile) over a single-app solution because notifications come from many apps, and built it as an interactive Figma prototype.
- Ran a scenario-based usability test (n=6) and made three design refinements informed by the feedback.

Our Orchard – App Product Design (team), Imperial College London 2026

- Conducted stakeholder insight interviews with six participants on how couples share and coordinate household tasks; synthesised three themes: tasks are invisible, asking for help adds to the load, and partners perceive difficulty differently.
- Explained each theme with COM-B and Self-Determination Theory and traced it to a prototype feature (task visualisation, dual difficulty rating, light communication prompts); benchmarked against existing task and calendar tools.
- Team project: my part was the interview research, data analysis and the behavioural theory behind the design rationale; the prototype UI was built by the team.
- Showed participants the design framework and rationale; feedback included liking the apple metaphor and visual expression and a need for low-cost communication, and the team then added a meme-style encouragement and support feature (qualitative feedback, not a usability test).

For the Gram – Transformational Play (team), Imperial College London 2026

- Designed three mechanics within a team-built board game on trend-chasing tourism in Oʻahu: the base map, an Instagram-style like-accumulation mechanic, and a glass-jar spending feedback with an end reveal of environmental harm; playability mechanics and physical production were done by the team.

London Nudgeathon 2025 – FAO of the United Nations (team Highly commended) 2025

- Designed a savings intervention for women farmers in Sierra Leone in a 48-hour challenge, applying COM-B and APEASE to develop group-goal and agricultural-insurance incentives.
- Proposed a three-stage quasi-experimental evaluation plan to measure practicality, impact and sustainability.

Kaleidoscope – Interactive Design, Imperial College London 2026

- Built an interactive prototype that converts visual inputs into personalised music clips to create a synaesthetic experience.
- Tested the visual-to-audio mapping with users, who commented on the musical coherence and personal ownership of their generated music.

Hinge for Older Adults – UX Research, Imperial College London 2025

- Identified emotional support, safety validation, efficient matching and unbiased marketing as key needs affecting 55+ adults' dating experience.
- Proposed condensed layouts, safety badges and social-support nudges to improve trust in the matching system and community.

SKILLS

Product & research: user interviews, surveys, co-design workshops, usability testing, problem framing, option trade-offs

Data & product analysis: Python, RStudio, Excel, statistical analysis, exploratory data analysis

Design & prototyping: Figma interactive prototyping, wireframing, user flows

Research tools: NVivo, Qualtrics, Gorilla, Prolific, XMind

Languages: Mandarin Chinese; English (Advanced; IELTS 7.5)
